

O_Chart

A small office chat app I built in C++

What I Built

A local-network console chat app where one machine hosts a room and multiple users join with the host IP.

- Host/join mode in one executable.
- Multi-client TCP message relay.
- No saved database or chat log.

What Made It Interesting

- I had to split server and client event loops so the host could also chat.
- A signed short overflow broke port 54000.
- Async messages forced me to clean up the console UX.

How I would post it: a privacy-oriented C++ LAN chat prototype. I would not call it production-grade secure messaging yet.
